

STEM faculty socialized in STEM culture may view successes and failures as stemming from merit

Discussion Questions:

1. How does color-evasive ideology allow scientists to sidestep responsibility in addressing racial inequality in their disciplines? (b) In what ways could good intentions still result in bad consequences?
2. What's the difference between explaining underrepresentation as a result of 'individual choice' versus 'systemic racism'? (b) How do these two views shape the types of mentoring or institutional changes one would recommend?
3. Where do you identify potential for learning or change in your own practice?

This color-evasive lens negatively affects faculty's ability to perceive discrimination

Discussion Questions:

1. How does color-evasive ideology allow scientists to sidestep responsibility in addressing racial inequality in their disciplines? (b) In what ways could good intentions still result in bad consequences?
2. What's the difference between explaining underrepresentation as a result of 'individual choice' versus 'systemic racism'? (b) How do these two views shape the types of mentoring or institutional changes one would recommend?
3. Where do you identify potential for learning or change in your own practice?

STEM socialization is so strong that students who graduate with 4-year degrees tend to explain being excluded in the workforce through a meritocratic lens

Discussion Questions:

1. How does color-evasive ideology allow scientists to sidestep responsibility in addressing racial inequality in their disciplines? (b) In what ways could good intentions still result in bad consequences?
2. What's the difference between explaining underrepresentation as a result of 'individual choice' versus 'systemic racism'? (b) How do these two views shape the types of mentoring or institutional changes one would recommend?
3. Where do you identify potential for learning or change in your own practice?

Color-evasiveness erases the experience of exclusion of students of color because race is never acknowledged

Discussion Questions:

1. How does color-evasive ideology allow scientists to sidestep responsibility in addressing racial inequality in their disciplines? (b) In what ways could good intentions still result in bad consequences?
2. What's the difference between explaining underrepresentation as a result of 'individual choice' versus 'systemic racism'? (b) How do these two views shape the types of mentoring or institutional changes one would recommend?
3. Where do you identify potential for learning or change in your own practice?
